

Weird Washrooms

- **No flushing?**

Water is only used to wet the mass of matter below you. No drinking water is wasted to flush. A fan removes odours down and out (feel that draft?).

- **Where does "IT" all go?**

Large containers in the basement hold "IT" until it is thoroughly broken down into organic material (=humus).

- **What happens with "IT"?**

"IT" decomposes – a process helped by earthworms, bacteria and insects. What is left can be used as soil conditioner.

- **What about disease organisms?**

Disease organisms die and are consumed by the earthworms, bacteria and insects.

- **What about pollution?**

90% of the material is converted into carbon dioxide and water vapour. The rest is humus.

PLEASE put the lid down before you leave.
